Spike reports

Time-boxed investigations run to resolve a specific uncertainty before it can affect design or implementation. Each produces a report with a stated method, raw output, and limitations.

ID	Spike	Date	Status	Outcome
NOVA-SPK-001	Local model selection under a 6 GB VRAM ceiling	2026-09-07	Partial	The 4B-parameter class holds the test plan schema at 9 to 26 s warm, fully GPU-resident. The 8B class remains unmeasured

Planned

Spike	Resolves	Blocking
Embedding model and vector dimension	ADR-0005 , R-04	Yes. Blocks schema definition
Container-to-host inference reachability	R-09	No, but it is the most probable early impediment

Conventions

- A spike is time-boxed before it starts. Exceeding the box is itself a finding
- Every report states its method, its sample size, and its limitations. A measurement without a stated sample size is not a result
- Harnesses and raw output are committed under `artifacts/` so that any figure can be reproduced
- A partial spike is reported as partial. Unmeasured candidates are listed as unmeasured rather than omitted
- Recommendations arising from a small sample are marked provisional and do not become decisions until confirmed
